HOL 10 – Signal R & Event Processor Host

Code & Modules

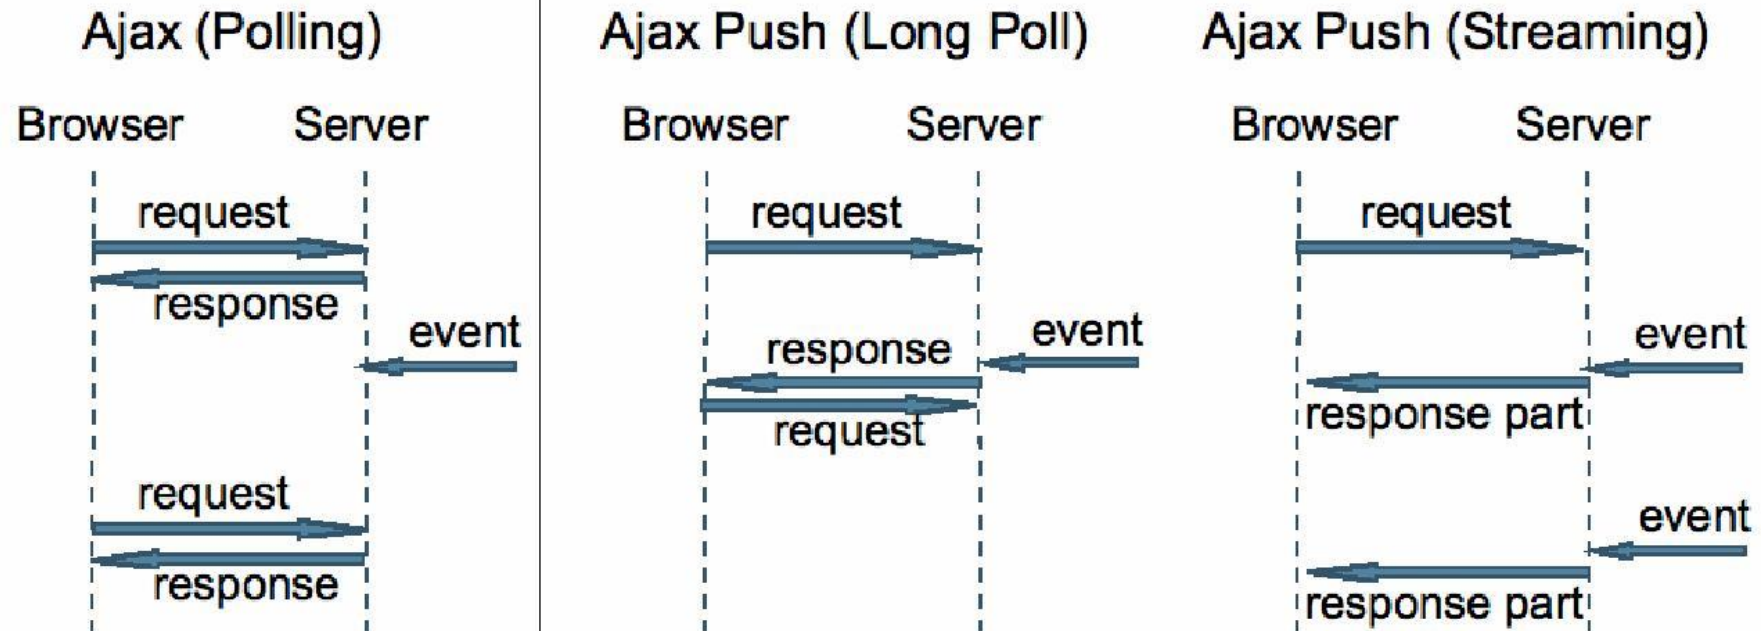

Code & Modules

SignalR

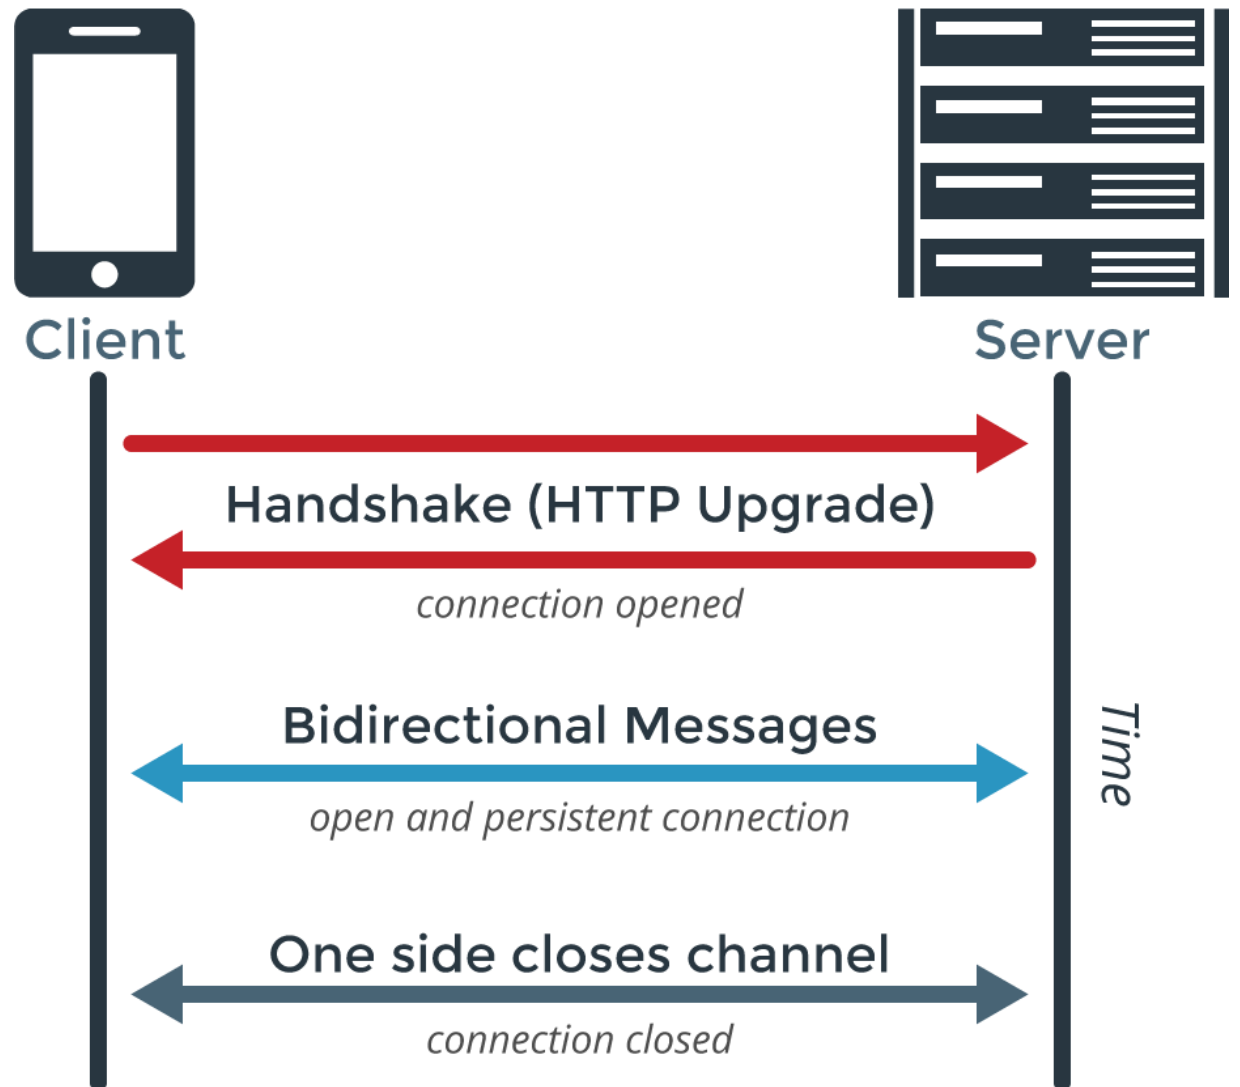

Real-time data transmission - HTTP

- Stateless
- Comet Programming
 - Polling on Long Polling
 - XmlHttpRequest or Iframe

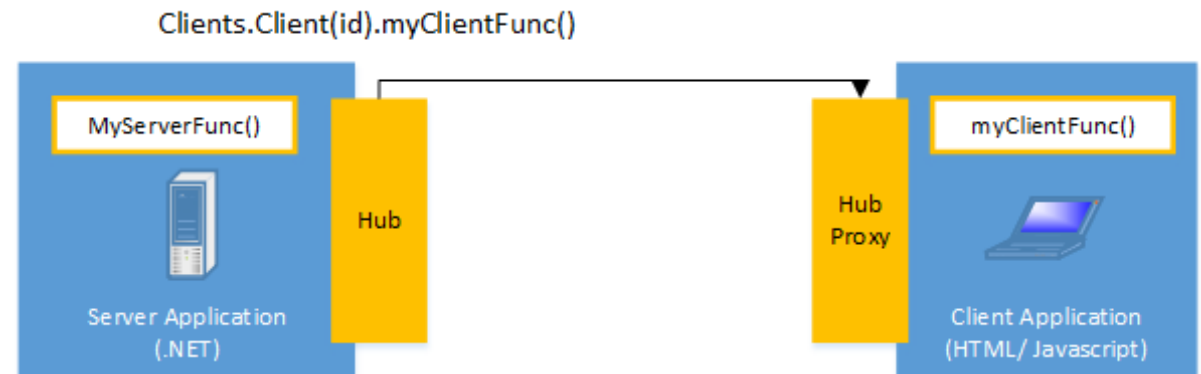

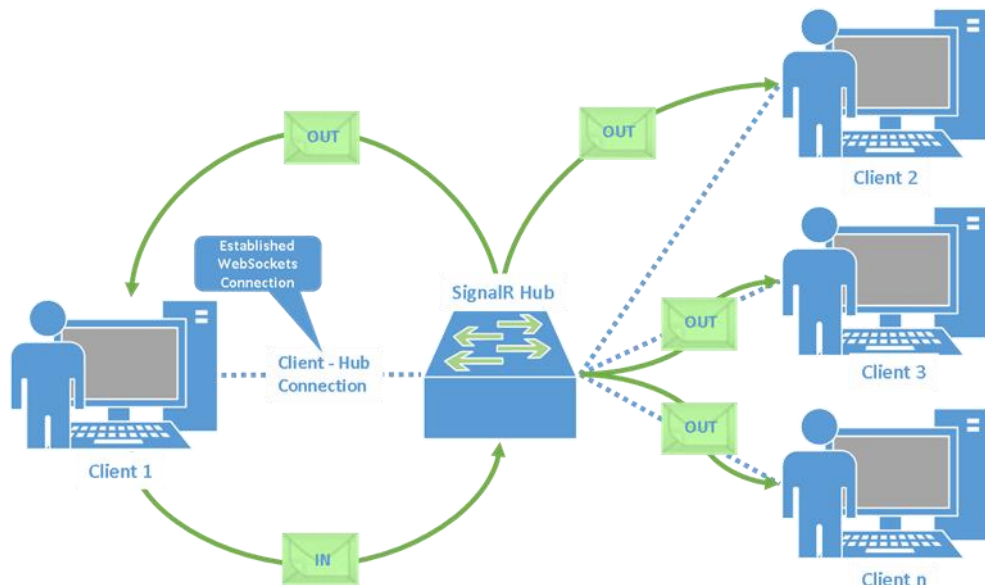

Real-time data transmission - WebSocket

- Stateful
- HTML5
- Provide a persistent connection between a client and server

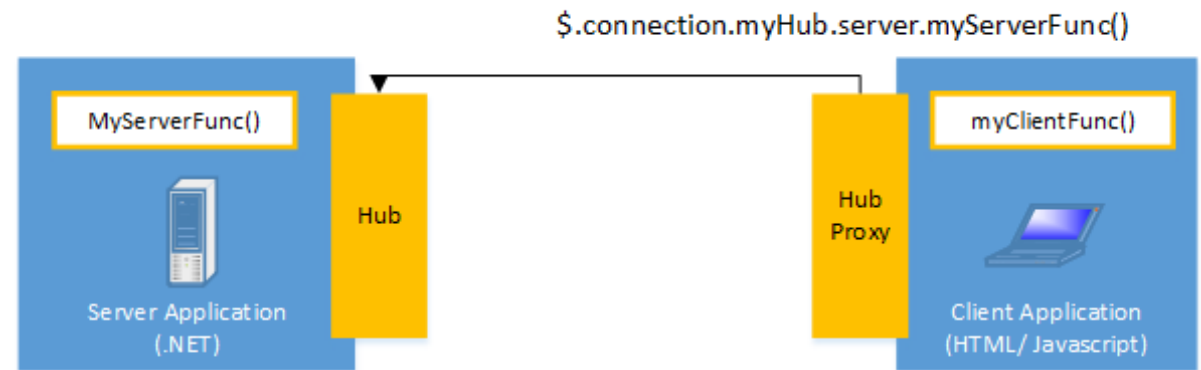

SignalR

- .NET(Server) and Javascript (Browser)
- Handles connection management automatically
- The connection between the client and server is persistent

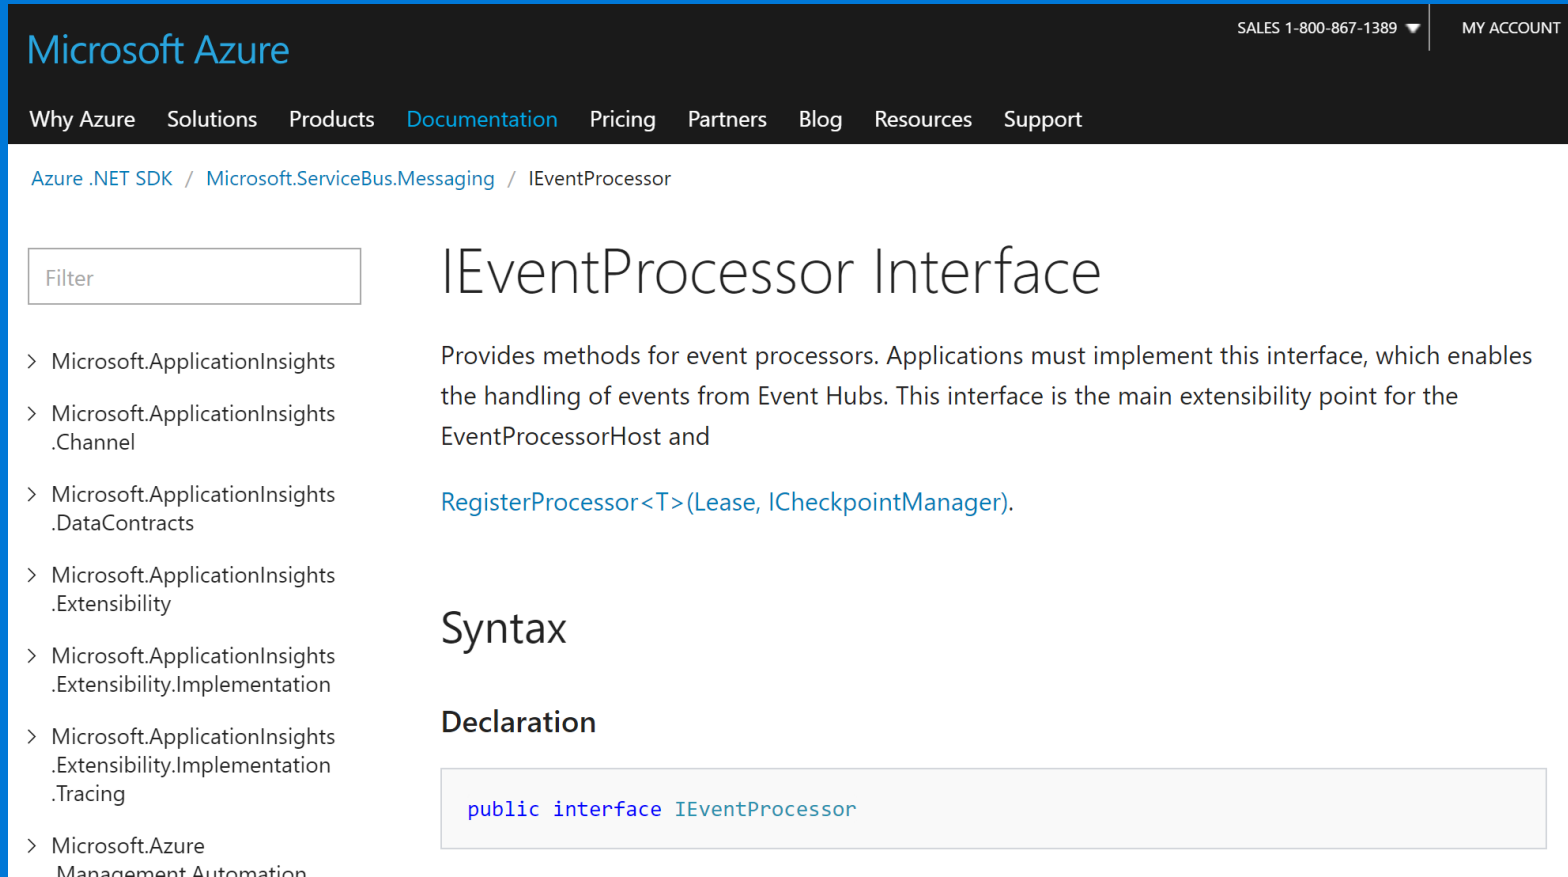

Server invocation of client method
myClientFunc()

Client invocation of server method
MyServerFunc()

Event Processor Host

Event Processor Host

The screenshot shows the Microsoft Azure documentation page for the `IEventProcessor` interface. The page has a dark blue header with the Microsoft Azure logo and navigation links. The main content area is white and features a search filter, a list of navigation links, and the main documentation text for the `IEventProcessor` interface.

IEventProcessor Interface

Provides methods for event processors. Applications must implement this interface, which enables the handling of events from Event Hubs. This interface is the main extensibility point for the EventProcessorHost and

[RegisterProcessor<T>\(Lease, ICheckpointManager\).](#)

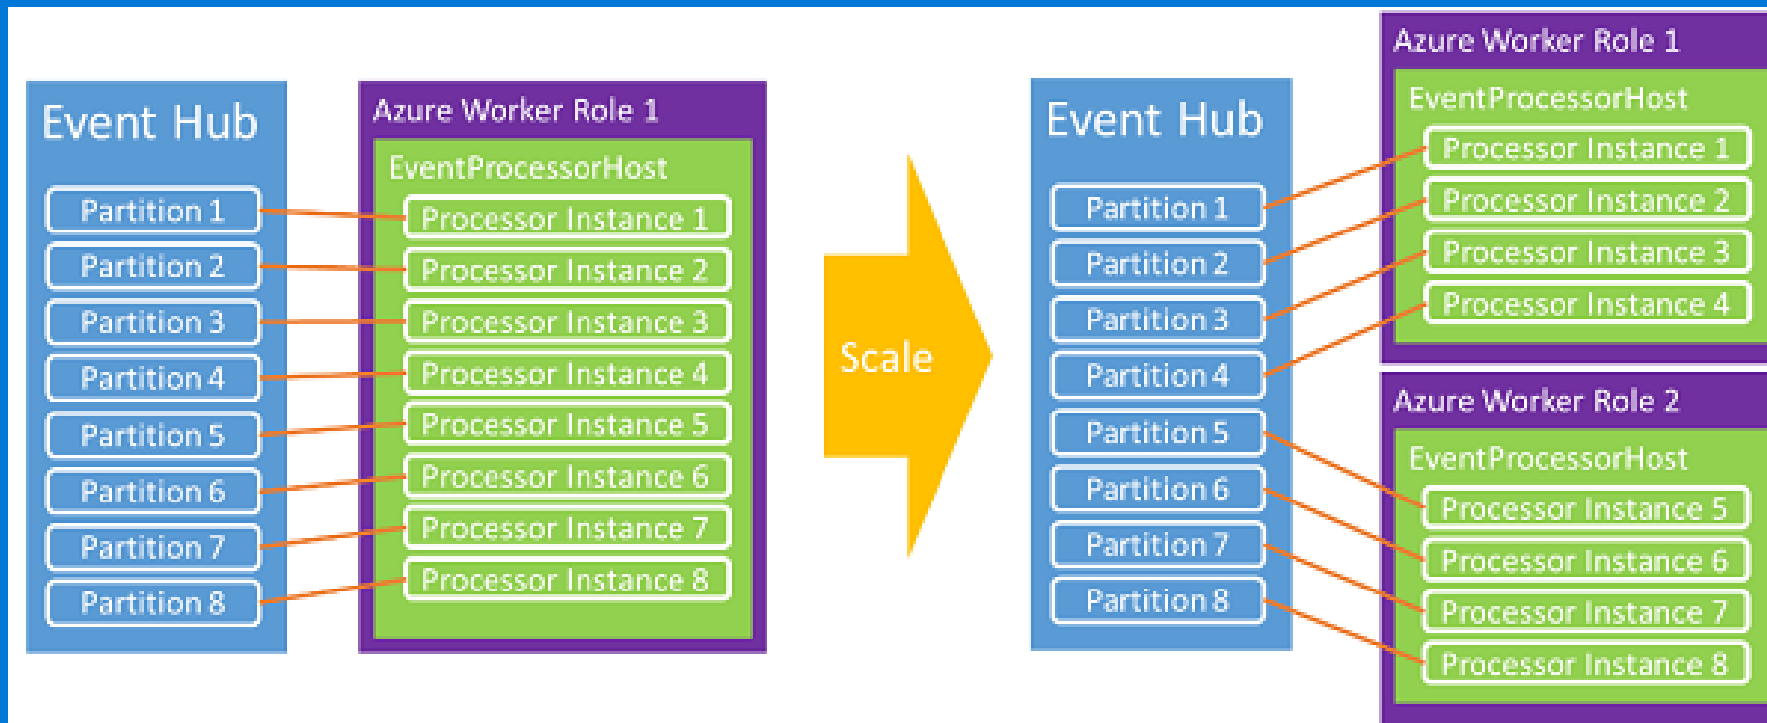

Syntax

Declaration

```
public interface IEventProcessor
```

- The EventProcessorHost class processes data from Event Hubs.
- Building event readers on the .NET platform
- Provides a thread-safe, multi-process, safe runtime environment
- Also provides checkpointing and partition lease management

Let's Go

- Using **Event Processor Host** to get the telemetry data from IoT Hub, and post data to Web Server.
- Using **SignalR** to update the dashboard UI between the Web Server and Client Browser.

(Please refer the 10-HOL-SignalR and Event Processor Host file)
